Demo script: a day at the clinic (12–15 minutes)

Story: a new patient registers, books, asks the assistant, chats with the front desk; then Bea (a returning patient) pays her invoice online and gets her receipt; the Owner changes the brand colour and an assistant answer live. Every step has a **FALLBACK**. Times are targets; the total is about 18 minutes with the round-2 steps 3c–3e (cut 3e first if short of time).

Accounts (demo database only; password `DemoPass123` unless noted)

Who	Sign in	Window
New patient (registered live)	a new Gmail alias, e.g. `jaztinalcantara17+panel1@gmail.com`, password `NewPatient#2026`	Window A, phone size (390 px)
Bea Villanueva (returning patient, unpaid invoice)	`jaztinalcantara17+demo@gmail.com`	Window A after step 6
Front desk (Staff)	`staff.reception@example.test`	Window B, desktop
Owner	`owner@example.test`	Window B after step 7

Gmail (the `jaztinalcantara17` inbox) is open in Window C.

Start, check, reset

```
NGROK_DOMAIN=unclear-jase-enviously.ngrok-free.dev scripts/demo-start.sh          # API (4 workers), worker,
scheduler, Reverb, tunnel, web
NGROK_DOMAIN=unclear-jase-enviously.ngrok-free.dev scripts/predefense-check.sh    # every line PASS (WARN for
drafts is fine)
DEMO_PATIENT_EMAIL=jaztinalcantara17+demo@gmail.com scripts/demo-reset.sh          # fresh demo clinic (asks you
to type RESET)
scripts/payment-test.sh demo-db jaztinalcantara17+demo@gmail.com                   # one more unpaid invoice for
Bea (invoice email)
```

Pre-demo checklist (one page, 30 minutes before)

- Laptop on power; Do Not Disturb on; notifications off; browser zoom 100%.
- Internet works; phone hotspot ready as backup.
- Postgres.app running; `demo-start.sh` running with the tunnel; `predefense-check.sh` all PASS (assistant drafts WARN is fine).
- Demo reset done today; then one unpaid invoice issued for Bea (invoice email arrived in Gmail).
- Gmail open in Window C, logged in, inbox sorted newest first; the aliases arrive in the same inbox.
- Window A at 390 px on the landing page (`http://localhost:5173/`); Window B signed in as `staff.reception@example.test` on Messages.
- PayMongo dashboard in **test mode**; the webhook points to `https://unclear-jase-enviously.ngrok-free.dev/api/webhooks/paymongo`.
- Backup tab: `http://localhost:8000/dev/mail` (email previews and PDFs).
- Backup: the screen recording of the full demo on the desktop (made the day before).
- Backup: `docs/ui-review/patient/` screenshots open in a folder.
- A paid invoice exists for Bea (the reset seeds two paid ones), for the receipt fallback.

The script

#	Time	Do (exact clicks)	Say	FALLBACK
1	0:00–1:30	Window A (phone size) on the **landing page**: scroll the hero, **How it works**, **Services** (real services, no prices), **Branches** (real addresses and phones, today's hours and "Open now / Closed" in Philippine time, Get directions), the FAQ and the emergency note.	"Dr. Roxas told us: long queues and waiting (Q19, Q21), scheduling conflicts (Q20), and she answers Messenger herself (PI-43). This is the clinic's own website: every branch, hour and service comes from the clinic's records."	API slow: the sections show loading cards, then a friendly message with the clinic phone; continue with **Create account**.
2	1:30–3:00	Window A: hero **Book a visit** → the Create account card: fill name, birth date, the new alias, phone (e.g. 917 123 4567), password (watch the strength meter), tick the Privacy/Terms box → **Create account**. Window C: open the code email. Window A: type the code → **Verify email**. The sign-in page opens with the email filled in and the message "Your account is verified. Please sign in." → type the password → **Sign in**.	"Sign-up is verified with a one-time code by email. After verifying, the patient signs in themselves." Point at the welcome card: "No appointments yet. Book your first visit."	Gmail slow: open `localhost:8000/dev/mail` → *One-time code* to show the email design, and use an alias registered earlier (already verified).
3	2:30–4:30	**Book your first visit** → service **Oral Prophylaxis** → browser asks for location → **Allow** → the recommended branch "Closest to you, earliest slot…" → tap it → **Any available dentist** → calendar: point at Sunday greyed out → tap the first available day → tap a time chip → Review → **Confirm appointment** → **Add to calendar**. Window C: the confirmation email.	"Only real open times are shown, so double booking is impossible — the database itself refuses overlaps. Nothing is paid at booking."	Location blocked: say "without location it ranks by the earliest slot" and continue. Email slow: `/dev/mail` → *Appointment confirmation*.

#	Time	Do (exact clicks)	Say	FALLBACK
3b	+60 s	**Reminder arrives.** Note the new appointment code (APT-…) on the confirmation. Window B (or a prepared terminal in `backend/`): Owner → **Administration** → **Automations** → **Demo tools** (bottom, demo database only) → **Demo clock** → type the code → **Run now** (terminal: `DB_DATABASE=dental_clinic_demo php artisan automations:demo --appointment=APT-…`). The card shows "simulated … · sent 1". Window C: the **Reminder** email arrives within seconds: date and time in Philippine time, branch, address, phone, that day's hours, **Reschedule or cancel**, calendar file. Tap the button: it opens **My visits** on that appointment.	"PI-31: the front desk reminds every patient today. The system now sends the reminder by itself, 24 hours before by default; the Owner can change that. If the visit is moved, the reminder is recalculated; if it is cancelled, none is sent; it is never sent twice."	Gmail slow: open `localhost:8000/dev/mail/appointment-reminder`. Demo clock refused: you are not on the demo database.
3c	+90 s	**Approve the wording first.** Window B as Owner → **Administration** → **Automations**: the **Appointment reminders** row says "Needs wording approval" → tap **Approve the wording first: Appointment reminder** (the email preview opens under **Email wording**) → **Approve this wording**; do the same for "Are you on your way?", "Released: rebook invitation" and "An earlier time is available"; switch on **Appointment reminders**, **Late arrivals and no-shows** and **Fill freed times** (each chip turns to **Active**; timings are under **Details**).	"The clinic told us the Owner approves the wording (R2-09). Nothing is sent until she does, and each default says whether the clinic gave it or we recommend it."	If a switch stays disabled, the card says which wording still needs approval.
3d	+120 s	**15-minute release, then a move-up offer.** Before the demo the front desk booked two of today's appointments with the same dentist: Patient X (earlier) and Bea (later, her real inbox). Owner → **Demo clock** → "Today's appointment code" = X → **Run now**. Window B as Staff → **Check-In**: "Released today" shows X with **Undo**, "Free times today" shows the time as offered. Window C: Bea's email "An earlier time is available" → **Take the earlier time** → confirm. Bea's **My visits** shows the earlier time.	"After 15 minutes without check-in the time is released (R2-10) and offered first to a patient booked later that day. The first to accept gets it; nobody is moved without saying yes."	Show `InterviewRoundTwoTest` (the race test) and `docs/ui-review/r2/` screenshots.
3e	+45 s	**Staff calendar.** Staff → **Appointment Calendar** → **Week** then **Month**: each day shows "% booked" with a colour band and a legend, crowded days are marked, closed days are grey with the reason; chips show the patient's initials, service and dentist.	"The clinic liked seeing crowded days in advance (R2-02). Load is booked minutes against the dentists' hours, shown as a number, never colour alone."	Screenshot `docs/ui-review/r2/staff-calendar-month-desktop.png`.

#	Time	Do (exact clicks)	Say	FALLBACK
3f	+60 s	**Walk-in at the counter.** Window A (phone size): open the counter poster's link (`#join/b1`) → **I'm new here** → **Scan your ID** → consent → choose `docs/ui-review/intake/specimens/philid_qr-clean.png` (synthetic) → the name and birth date fill in, highlighted → mobile, emergency contact, consent → today's code from Window B → **Register and join today's queue**. Window B (Staff) **Check-In**: "Self-registered: verify ID" → **Review and confirm** → tick "I checked this ID" → **Confirm and add to today's queue**.	"No paper form and no retyping (R2-03). The ID was read on the phone and not kept; staff check it once. If this person was registered at another branch, staff would see 'Record found from Branch X' (R2-08)."	Screenshots in `docs/ui-review/intake/`.
3g	+60 s	**A dentist's leave.** Window B as Owner → **Team** → **Work Schedules**: pick the dentist, show the weekly hours ("demo schedule, not confirmed by the clinic") and change one day's end time: an error explains it must be inside the branch hours. Then **Leave Requests**: the pending request the dentist sent before the demo (tomorrow, full day) → **Booked appointments** shows one visit and "Move to Dr. …" → **Approve**. Window A (patient, **Book a visit** for tomorrow with that dentist): the day has no times now. Back in B: **Move to Dr. …** on the affected visit (or **Email them a reschedule link**).	"Leave and schedules are rules, not hard-coded shifts: approving takes the dentist's time out of booking at once, and nothing is cancelled. The front desk sees who is affected and moves them to a free dentist in one click."	Screenshots in `docs/ui-review/m3-m15-m25/`.
3h	+60 s	**Dentist: prescription and follow-up.** Window B as the Dentist → **Prescriptions** → choose today's visit → note "Check allergies before prescribing" → one line (e.g. "Mefenamic acid 500 mg", 1 tablet, every 8 hours, 3 days) → **Issue prescription**: number RX-2026-… Window A (patient, phone): **More** → **Prescriptions** → **Download PDF**. Back in B: **Void…** with a reason → it shows VOID. Then Staff → **Follow-Up Tasks**: the task from that treatment → **Book follow-up** (patient, branch, service already chosen) → pick a time → the task shows **Booked**.	"Only the dentist writes it; once issued it is locked and numbered, and a mistake is voided, never edited. There is no drug database and no interaction check: the dentist decides. The follow-up the dentist asked for became a task, and booking it closed the loop by itself."	Screenshots in `docs/ui-review/m19-m20-m10/`.

#	Time	Do (exact clicks)	Say	FALLBACK
4	4:30–5:30	Tap **Ask us** → type "Bukas ba kayo sa Linggo?" → then "When is my next appointment?"	"The assistant answers in English and Filipino from the clinic's own approved answers and records. It never invents: unknown questions go to the front desk."	Assistant error: show `docs/ui-review/patient/assistant/new-02-answers-phone.png`.
5	5:30–7:00	Window A: **Messages** → **New message** → shows "To: Dr. Dana Roxas Dental Clinic front desk · Change" → type "Good day, may I bring my child too?" → **Send**. Window B (Staff): the conversation appears → reply "Yes, please book a Pediatric Consultation for your child." Window A: the reply appears live; the bell shows 1.	"The message goes to the right branch automatically. If the patient is away, they get a short email alert — never the message text."	Realtime down (Reverb): reload Window A; the reply is there.
6	7:00–10:30	Window A: profile menu (**More** → Sign out) → sign in as Bea. Window C: open her **invoice email** (from the checklist). Window A: **Billing** → **Review and pay** → **Pay ₱1,800 securely with PayMongo** → on PayMongo: **E-Wallets** → **GCash** → **Continue** → (name and email are filled in) **Pay ₱ 1,800.00** → test page: **Authorize Test Payment** → back in the portal after about 25 s: "Confirming your payment" → "Payment received" (about 30 s). Note: in test mode the PayMongo page shows the developers' account name (OPEN_ITEMS 13). Window C: the **Payment Receipt** email with the PDF. Window A: **Receipt PDF**.	"The invoice is made from the treatment. PayMongo calls our server; only that verified call marks it paid and issues the receipt. Nobody types the payment."	Tunnel/webhook down: Bea's **paid** invoice → **Receipt PDF**, and `/dev/mail` → *Payment receipt*. PayMongo down: Window B (Staff) → Billing → record a **Cash** payment → the receipt appears.
7	10:30–12:30	Window B: sign out → sign in as **Owner** → **Clinic Branding** → change the **Primary** colour → **Save branding**. Window A (Bea): **Billing** → **Invoice PDF**: the PDF uses the new colour (the brand colours style the emails and PDFs; the portal keeps its accessible design A colours). Owner → **Assistant Answers** → open "Do you accept HMO?" → **Edit** → adjust the wording → **Save** → **Confirm**. Test box: type "Tumatanggap ba kayo ng HMO?" → shows the new answer and its confidence.	"The Owner controls the brand on every email and PDF, and every answer the assistant gives; each change is in the audit trail."	Save fails: show `docs/ui-review/patient/assistant/owner-assistant-answers-desktop.png`.
8	12:30–14:00	Owner → **Audit Trail** (latest entries) → Status slide.	"This is what is built, what is partly built and what is not started; and the decisions we need from the clinic."	—

After the demo

- `scripts/demo-reset.sh` to start fresh (the panel's test accounts are removed).
- Do not show `backend/.env` or the PayMongo dashboard keys.

If everything fails

Play the screen recording made the day before (Window D), and narrate the same steps. Then open `docs/defense/AUTOMATION_EVIDENCE.md`.
